

HeLa Mononucleosomes, Purified

Catalog No. 16-0002

Lot No. 15105006

Pack Size 50 µg

Product Description:

Human mononucleosomes purified from HeLa cells. The nucleosome is the basic subunit of chromatin consisting of the histone octamer (two each of the four core histones, H2A, H2B, H3 and H4) wrapped by 147 base pairs of DNA.

Formulation:

Purified HeLa mononucleosomes at a concentration of 1.5 mg/ml (DNA+protein) in 20 mM HEPES, pH 7.5, 1 mM EDTA. **Concentration may differ from previous lots.**

Storage and Stability:

Stable for six months at -80°C from date of receipt. For best results, aliquot and avoid multiple freeze/thaws.

Application Notes:

HeLa mono-nucleosomes are suitable for use in enzyme assays such as acetylation or methylation, chromatin binding assays, or for use as a positive control in Western blotting. Use 1-2 µg per reaction.

***-NB.** Despite the high purity of the preparation, a small amount of arginine methyltransferase activity is tightly associated and co-purifies with the nucleosomes. If you are studying weak or low turnover HMTases, you can use AMI-1 to inhibit the endogenous RMTase activity.

EpiCypher™

DNA Gel Data: DNA was purified from 0.5 µg HeLa Mono-nucleosomes and run on an agarose gel to show the size of nucleosomal DNA compared to MW markers. Note that mononucleosomal DNA runs at ~150 base pairs.

Protein Gel Data: Coomassie stained PAGE gel of proteins in 1 µg of HeLa Mononucleosomes to demonstrate the purity of the histones in the preparations. Sizes of molecular weight markers (kDa) and position of the core histones are indicated.

Histone Methyltransferase Data: HeLa Mononucleosomes were used in a radioactive histone methyltransferase assay with recombinant SET8. Radioactive SAM was incubated with HeLa Mononucleosmes (Nucs, 1.5 µg), recombinant SET8 (SET8, 1 µg), or both (SET8+Nucs). HMTase activity co-purifying with the nucleosomes is virtually undetectable.
